

AUDIO 2-CHANNEL 16-BIT D/A CONVERTER

The μ PD6376 is an audio 2-channel 16-bit D/A converter.

The μ PD6376 has low sound quality deterioration by employing the resistor string configuration and 0-point offset, and low power consumption by using the CMOS process. It operates on a single 5-V power supply, and it is pin-compatible with the μ PD6372 when Pin 1 is low level or open.

FEATURES

- Single 5-V power supply
- CMOS structure
- On-chip output operational amplifier circuit
- On-chip 0-point offset circuit
- Resistor string configuration
- 8 fs (2 ch \times 400 kHz) supported
- On-chip 2-channel DAC
- L-R in-phase output

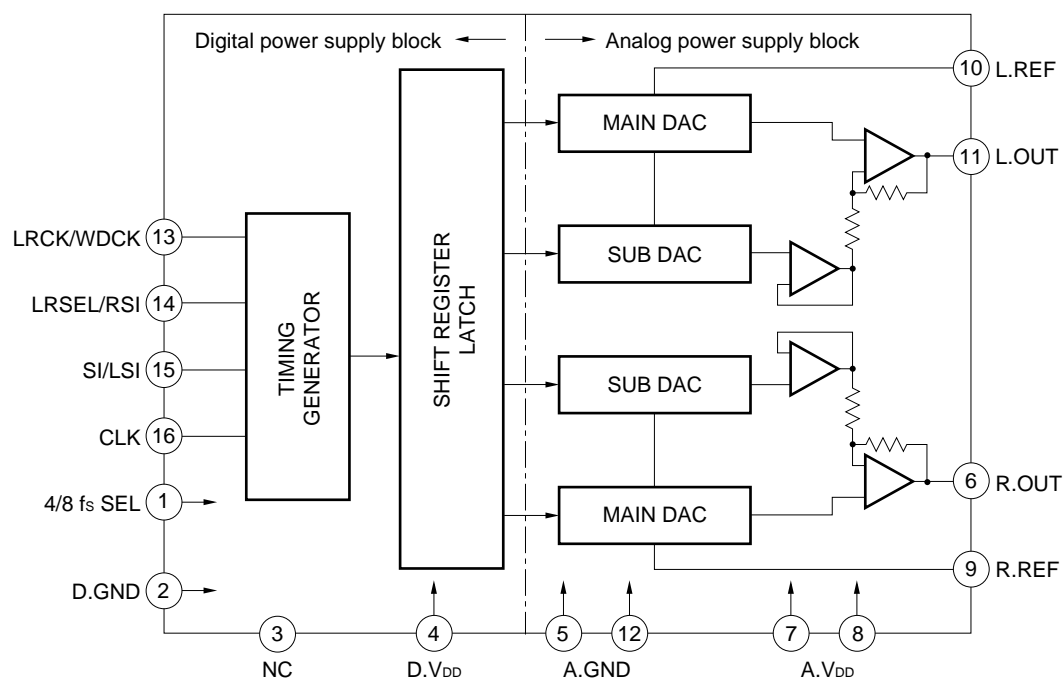

★

ORDERING INFORMATION

| Part Number | Package |
|----------------|------------------------------|
| μ PD6376GS | 16-pin plastic SOP (300 mil) |

The information in this document is subject to change without notice.

BLOCK DIAGRAM

PIN CONFIGURATION (Top View)

16-Pin Plastic SOP (300 mil)

1. PIN FUNCTIONS

| Pin No. | Symbol | Name | I/O | Function |
|---------|-------------------|---|--------|---|
| 1 | 4/8 fs SEL | | Input | When this pin is Low or leaves Open, L-ch data and R-ch data is input in time-division from Pin 15. When this pin is High, L-ch data is input from Pin 15, and R-ch data is input from Pin 14. (Pulled down in IC with 100-kΩ resistor) |
| 2 | D.GND | Digital GND | — | GND pin of logic block |
| 3 | NC | Non Connection | — | Not connected to internal chip |
| 4 | D.V _{DD} | Digital V _{DD} | — | Power supply pin to logic block |
| 5 | A.GND | Analog GND | — | GND pin to analog block |
| 6 | R.OUT | R-ch OUTPUT | Output | Right analog signal output pin |
| 7 | A.V _{DD} | Analog V _{DD} | — | Power supply pin to analog block |
| 8 | A.V _{DD} | Analog V _{DD} | | |
| 9 | R.REF | R-ch Voltage Reference | — | Reference voltage pin. Normally connected to A. GND through via capacitor to lower impedance |
| 10 | L.REF | L-ch Voltage Reference | | |
| 11 | L.OUT | L-ch OUTPUT | Output | Left analog signal output pin |
| 12 | A.GND | Analog GND | — | GND pin of analog block |
| 13 | LRCK/WDCK | Left/Right Clock WORD Clock | Input | When Pin 1 is Low or leaves Open: Functions as L-R judgment signal input pin. When Pin 1 is High: Functions as input data word judgment signal input pin. |
| 14 | LRSEL/RSI | Left/Right Selection R-ch Series Input | Input | When Pin 1 is Low or leaves Open: Functions as pin to select L-R polarity for LRCK signal. When LRCK signal is High, set LRSEL pin to Low to input L-ch data; When LRCK signal is LOW, set LRSEL pin to High to input L-ch data. When Pin 1 is High: Functions as R-ch serial data input pin. |
| 15 | SI/LSI | Series Input L-ch Series Input | Input | When Pin 1 is Low or Open: Functions as L-ch and R-ch serial data input pin alternately. When Pin 1 is High: Functions as L-ch serial data input pin. |
| 16 | CLK | CLOCK | Input | Input pin for read clock of serial input data |

2. INPUT SIGNAL FORMAT

- Input data must be input as 2's complement, MSB first.

★ 2's complement is a method of expressing both positive numbers and negative numbers as binary numbers. See the table below.

| (MSB) | 2's Complement | | | (LSB) | Decimal Number | L.OUT, R.OUT Pin Voltage TYP. (V) (Reference Values) ^{Note} |
|-------|----------------|------|------|-------|----------------|---|
| 0111 | 1111 | 1111 | 1111 | | +32767 | 2.6 |
| 0111 | 1111 | 1111 | 1110 | | +32766 | ⋮ |
| | | ⋮ | | | ⋮ | ⋮ |
| 0000 | 0000 | 0000 | 0001 | | +1 | ⋮ |
| 0000 | 0000 | 0000 | 0000 | | 0 | 1.6 |
| 1111 | 1111 | 1111 | 1111 | | -1 | ⋮ |
| | | ⋮ | | | ⋮ | ⋮ |
| 1000 | 0000 | 0000 | 0001 | | -32767 | ⋮ |
| 1000 | 0000 | 0000 | 0000 | | -32768 | 0.6 |

Note When A.V_{DD} = 5.0 V

Values differ depending on IC fabrication variations, supply voltage fluctuations, and ambient temperature.

- Synchronize the (SI, LSI, RSI) data bit delimitations and the LRCK, WDCK reverse timing to the falling edge of CLK.
- CLK requires the input of 16 clocks between sample data (16 bits). Also, make the time interval for 1 bit the same as 1 clock cycle.

2.1 Supplying Clock to CLK even outside Sample Data Interval

2.1.1 Serial data input (Pin 1 is Low or Open)

Synchronize the reverse timing of LRCK with the falling edge of CLK upon completion of LSB input (Point A in **Figure 2-1**).

Figure 2-1 Timing Chart for Serial Data Input

2.1.2. Inputting parallel data (Pin 1 is High)

Synchronize the timing of the falling edge of WDCK with the falling edge of CLK upon completion of LSB input of data (LSI, RSI) (Point A in **Figure 2-2**).

Figure 2-2 Parallel Data Input Timing Chart

2.2 Supplying Clock to CLK only during Sample Data Interval

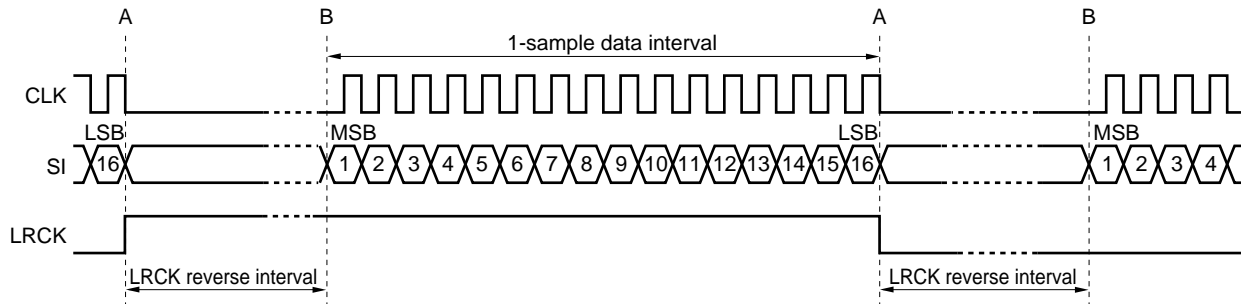

★

The analog outputs of the L.OUT and R.OUT pins are updated after the input of 4.5 clocks following data input. (See 4. ELECTRICAL CHARACTERISTICS, Timing Charts 1 and 2.)

2.2.1 Inputting serial data (Pin 1 Low or Open)

Place the LRCK reverse timing between the falling edge of CLK at LSB input completion (Point A in **Figure 2-3**) and the next MSB input start time (Point B in **Figure 2-3**) (so as to include Points A and B).

Figure 2-3 Timing Chart of Serial Data Input

2.2.2 Inputting parallel data (Pin 1 High)

Place the WDCK falling edge timing between the falling edge of CLK at LSB input completion (Point A in **Figure 2-4**) and the next MSB input start time (Point B in **Figure 2-4**) (so as to include Points A and B).

Place the WDCK rising edge timing between the third falling edge of CLK from MSB input completion (Point C in **Figure 2-4**) and the falling edge of CLK upon LSB input start (Point D in **Figure 2-4**) (so as to include Points C and D).

Figure 2-4 Timing Chart of Parallel Data Input

3. USAGE CAUTIONS

Insertion of a muting circuit in the next stage after the μ PD6376 is recommended.

If no muting circuit is inserted in the next stage, shock noise may be generated when power is applied.

4. ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings (T_A = 25°C)

| Parameter | Symbol | Rating | Unit |
|-------------------------------|------------------|------------------------------|------|
| Supply voltage | V _{DD} | −0.3 to +7.0 | V |
| Output pin voltage | V _{OUT} | −0.3 to V _{DD} +0.3 | V |
| Logic input voltage | V _{IN} | −0.3 to V _{DD} +0.3 | V |
| Operating ambient temperature | T _A | −20 to +75 | °C |
| Storage temperature | T _{stg} | −40 to +125 | °C |

Caution If any of the parameters exceeds the absolute maximum ratings, even momentarily, the device reliability may be impaired. The absolute maximum ratings are values that may physically damage the product. Be sure to use the product within the ratings.

Recommended Operating Range

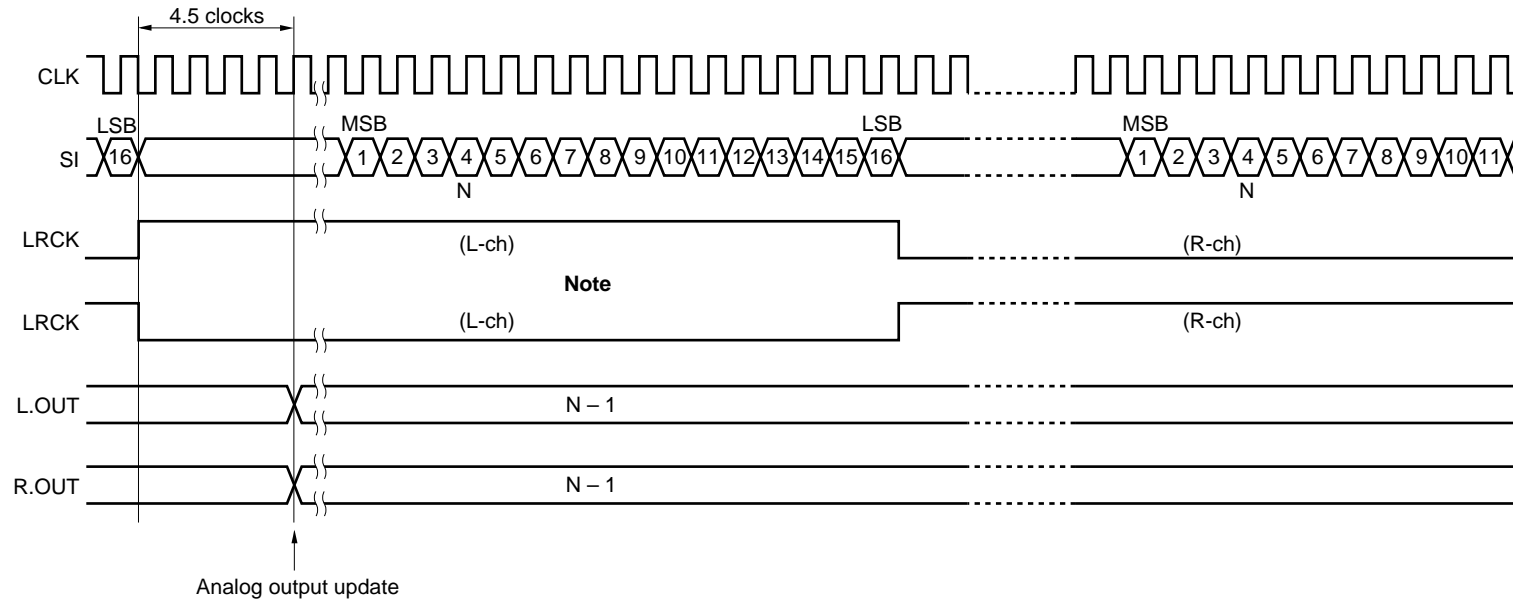

| Parameter | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|-----------------------------|------------------|--------------------|--------------------|------|--------------------|------|
| Supply voltage | V _{DD} | | 4.5 | 5.0 | 5.5 | V |
| Logic input voltage (High) | V _{IH} | | 0.7V _{DD} | | V _{DD} | V |
| Logic input voltage (Low) | V _{IL} | | 0 | | 0.3V _{DD} | V |
| Operating temperature range | T _A | | −20 | +25 | +75 | °C |
| Output load resistance | R _L | R.OUT or L.OUT pin | 5 | | | kΩ |
| Conversion frequency | f _S | | | | 400 | kHz |
| Clock frequency | f _{CLK} | | | | 10 | MHz |
| Clock pulse width | f _{SCK} | | 40 | | | ns |
| SI, LRCK set time | t _{DC} | | 12 | | | ns |
| SI, LRCK hold time | t _{CD} | | 12 | | | ns |

Electrical Characteristics (T_A = 25°C, V_{DD} = +5 V)

| Parameter | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
|-----------------------------|------------------|---|------|------|------|------------------|
| Resolution | RES | | | 16 | | Bit |
| Total harmonic distortion 1 | THD ₁ | f _{IN} = 1 kHz, 0 dB | | 0.04 | 0.09 | % |
| Total harmonic distortion 2 | THD ₂ | f _{IN} = 1 kHz, −20 dB | | 0.1 | 0.3 | % |
| Full-scale output voltage | V _{FS} | | | 2.0 | 2.3 | V _{p-p} |
| Cross talk | C.T | 0 dB per channel, f _{IN} = 1 kHz | 85 | 95 | | dB |
| S/N ratio | S/N | JIS-A | 96 | | | dB |
| Dynamic range | D.R | f _{IN} = 1 kHz, −60 dB | 92 | | | dB |
| Circuit current | I _{DD} | f _{IN} = 1 kHz, 0 dB | | 6.0 | 12 | mA |

10 ★ TIMING CHART 1

- When Pin 1 is Low or Open (serial input)

Note When the LRCK signal is High, set the LRSEL pin to Low to input L-ch data. When the LRCK signal is Low, set the LRSEL pin to High to input L-ch data.

★ TIMING CHART 2

- When Pin 1 is High (parallel input)

Typical Characteristics ($T_A = 25^\circ\text{C}$)

8. RECOMMENDED SOLDERING CONDITIONS

The following conditions must be met when performing soldering for the μPD6376.

For more detailed information, refer to the information document **Semiconductor Device Mounting Technology Manual** (C10535E).

For soldering methods and conditions other than the recommended conditions, please consult with an NEC sales representative.

Surface Mount Type Soldering Conditions

μPD6376GS: 16-pin Plastic SOP (300 mil)

| Soldering Process | Soldering Conditions | Symbol |
|---------------------|---|------------|
| Infrared reflow | Peak package temperature: 230°C, Time: 30 seconds max. (at 210°C or higher), Count: Once | IR30-00-1 |
| VPS | Peak package temperature: 215°C, Time: 40 seconds max. (at 200°C or higher), Count: Once | VP-15-00-1 |
| Pin Partial heating | Pin temperature: 300°C or less, Time: 3 seconds max. (per pin row) | — |

Caution Do not use different soldering methods together (except for pin partial heating).

[MEMO]

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note: Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note: No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS device behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note: Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

[MEMO]

The application circuits and their parameters are for reference only and are not intended for use in actual design-ins.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Anti-radioactive design is not implemented in this product.
